

- 1) Pre-requisite for Route53 is domain name.

Login to Godday.com and then create your own domain.

I choose rameshadapaka.ca as the domain name and purchased with 16\$ CAD per anum. (it seems like a reasonable price for a domain registration, considered monthly fee of 1.25\$)

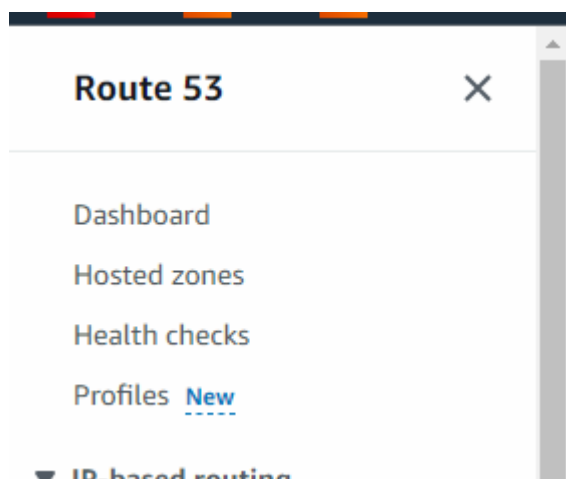

We can choose with other names as well for low cost or low prices.

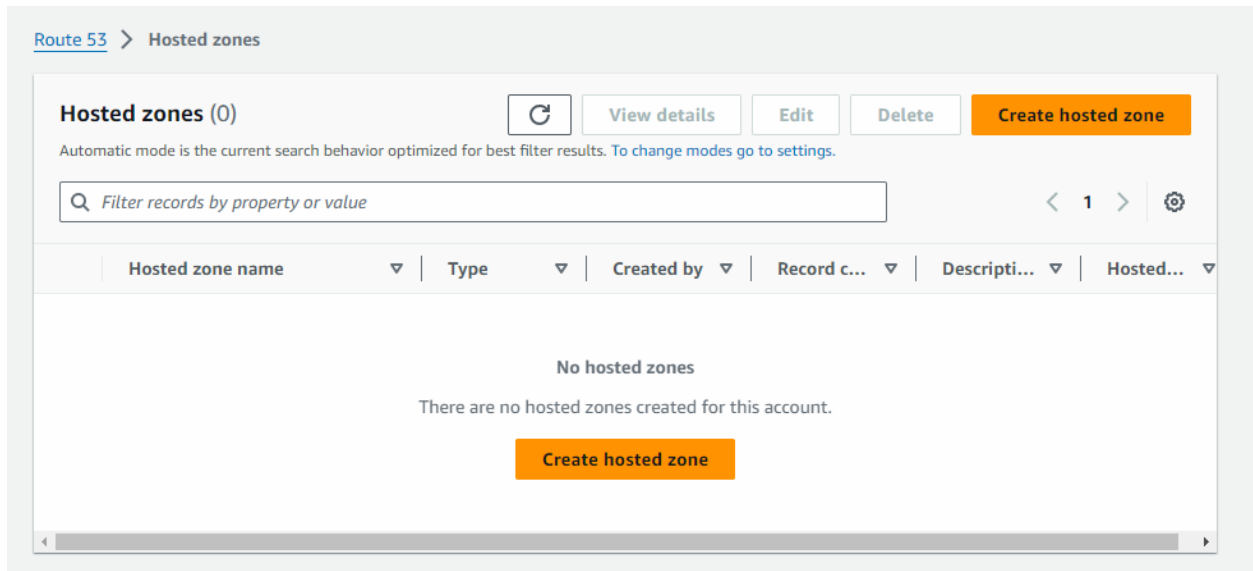

Note down my domain name: rameshadapaka.ca

- 2) Pre-requisite : Create a load balancer with an ec2 instance of t2.micro and then install httpd for testing the ec2 instance.

Create Route 53

Click on **Hosted zones**

Click on **Create hosted zone**

VEERA

[Route 53](#) > [Hosted zones](#) > Create hosted zone

Create hosted zone Info

Hosted zone configuration

A hosted zone is a container that holds information about how you want to route traffic for a domain, such as example.com, and its subdomains.

Domain name Info
This is the name of the domain that you want to route traffic for.

Valid characters: a-z, 0-9, ! " # \$ % & ' () * + , - . / : ; < = > ? @ [\] ^ _ ` { | } . ~

Description - optional Info
This value lets you distinguish hosted zones that have the same name.

The description can have up to 256 characters. 0/256

Type Info
The type indicates whether you want to route traffic on the internet or in an Amazon VPC.

☒ **Public hosted zone**
A public hosted zone determines how traffic is routed on the internet.

☐ **Private hosted zone**
A private hosted zone determines how traffic is routed within an Amazon VPC.

Tags Info

Apply tags to hosted zones to help organize and identify them.

No tags associated with the resource.

Add tag
You can add up to 50 more tags.

[Cancel](#) [Create hosted zone](#)

Click on **Create hosted zone.**

The screenshot shows the AWS Route 53 console. At the top, a green banner states: "rameshadapaka.ca was successfully created. Now you can create records in the hosted zone to specify how you want Route 53 to route traffic for your domain." Below this, the "Hosted zone details" section shows the domain "rameshadapaka.ca" with buttons for "Delete zone", "Test record", and "Configure query logging". The "Records (2)" tab is selected, showing a table of records. The first record is an NS record for "rameshadapaka.ca" with a TTL of 172800. The "Value/Route traffic to" column for this record is highlighted with a red box, showing a list of four AWS DNS servers: ns-1412.awsdns-48.org, ns-1588.awsdns-06.co.uk, ns-177.awsdns-22.com, and ns-554.awsdns-05.net. To the right, the "Record details" panel shows the same NS record with a red box around the "Value" field, which contains the same list of four AWS DNS servers.

Record name	Type	Routin...	Differ...	Alias	Value/Route traffic to	TTL (s...)
rameshadapaka.ca	NS	Simple	-	No	ns-1412.awsdns-48.org, ns-1588.awsdns-06.co.uk, ns-177.awsdns-22.com, ns-554.awsdns-05.net	172800
rameshadapaka.ca	SOA	Simple	-	No	ns-1412.awsdns-48.org, aws...	900

Copy each NS (name servers) and configure to our domain name.

The screenshot shows the "Domain" management interface for "rameshadapaka.ca". It includes a search icon, the domain name, and three buttons: "Forward Domain", "Manage DNS" (highlighted with a red box), and "Domain Settings".

Click on **Manage DNS**

The screenshot shows the "Domain Portfolio" page for "rameshadapaka.ca". It has tabs for "Overview", "DNS", and "Products". Under the "DNS" tab, there are sub-tabs: "DNS Records", "Forwarding", "Nameservers" (highlighted with a red box), "Premium DNS", "Hostnames", and "DS Records". Below the sub-tabs, there is a description: "DNS records define how your domain behaves, like showing your website content and delivering your email." and a button "Add New Record".

Click on Nameservers

Edit nameservers

Choose nameservers for **rameshadapaka.ca**

☐ GoDaddy Nameservers (recommended)

☒ I'll use my own nameservers

ns-1412.awsdns-48.org

ns-1588.awsdns-06.co.uk

ns-177.awsdns-22.com

ns-554.awsdns-05.net
