

Node Hello World

Simple node.js app that servers "A Monk in Cloud"

Great for testing simple deployments on Cloud

Step 1: Install NodeJS

```
sudo dnf install -y nodejs
```

```
```bash
node -v
npm -v
```
```

Step 2: Install Git and clone repository from GitHub

To install git, run below commands in the terminal window:

```
```bash
```

```
yum install git -y
```
```

Just to verify if system has git installed or not, please run below command in terminal:

```
```bash
git --version
```
```

This command will print the git version in the terminal.

Run below command to clone the code repository from Github:

```
```bash
git clone https://github.com/CloudTechDevOps/sample_nodejs_on_Ec2.git
```
```

Get inside the directory and Install Packages

```
```bash
cd nodejs-on-ec2
npm install
```
```

Start the application

To start the application, run the below command in the terminal:

```
```bash
npm start
```
```

some time the application may use port 81 which reserved for root user , if you want to run on that port use `sudo npm start`

To run the application, background we can use nohup command:

```
```bash
nohup npm start > output.log 2>&1 &
```
```

if you want to stop the process , get process id by using #ps aux --command.

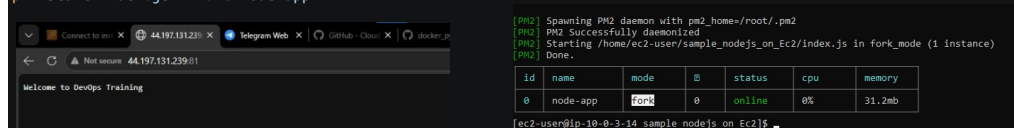

Then kill the process , #kill -9 PID .

```
```
```

or if we want to run application into process manager pm2

```
```bash
```

```
npm install -g pm2
pm2 start index.js --name node-app
```

The screenshot shows a terminal window with the following output:

```
[PM2] Spawning PM2 daemon with pm2_home=/root/.pm2
[PM2] PM2 Successfully daemonized
[PM2] Starting /home/ec2-user/sample_nodejs_on_Ec2/index.js in fork_mode (1 instance)
[PM2] Done.
```

id	name	mode	pid	status	cpu	memory
0	node-app	fork	0	online	0%	31.2mb

[ec2-user@ip-10-0-3-14 sample_nodejs_on_Ec2]\$

```
pm2 list    # List running apps
pm2 logs    # View logs
pm2 restart app # Restart app
pm2 stop app # Stop app
pm2 delete app # Remove app
pm2 save    # Save current process list
pm2 startup # Generate startup script
            for auto-start after reboot
```

```
#pm2 list
# pm2 logs
#pm2 stop 0 (app id)
```

to stop this use **#kill <PID>**

PM2 (Process Manager 2) is a powerful tool for managing Node.js applications in production environments. It ensures your app runs continuously, restarts on failure, and provides easy monitoring.
